# Ambiguity Removal

- The ambiguity removal is important in the grammar which consist of
  1. Logical Operators
  2. Arithmetic Operators
  3. If else statement
  4. Regular expressions operators

# Arithmetic Operators

- The two basic Properties of ambiguity removals are

1. Precedence
2. Associativity

Precedence	
+, -	4
*, /	3
^	2
Id/terminals	1

Associativity		
+, -	Left to right	Keep left recursion
*, /	Left to right	Keep left recursion
^	Right to left	Keep right recursion
id/terminal	-	

# Logical Operators

- The two basic Properties of ambiguity removals are
  1. Precedence
  2. Associativity

Precedence	
$\vee$	4
$\wedge$	3
$\sim$	2
Id/terminals	1

Associativity		
$\vee$	Left to right	Keep left recursion
$\wedge$	Left to right	Keep left recursion
$\sim$	Right to left	Keep right recursion
id/terminal	-	-

# Example

Ambiguous Grammar

$$E \rightarrow E \wedge E \mid E \vee E \mid \sim E \mid (E) \mid id$$

Unambiguous Grammar

$$E \rightarrow E \vee E_1 \mid E_1$$

$$E_1 \rightarrow E_1 \wedge E_2 \mid E_2$$

$$E_2 \rightarrow \sim E_2 \mid E_3$$

$$E_3 \rightarrow (E) \mid id$$

# Regular Expression Operators

- The two basic Properties of ambiguity removals are
  1. Precedence
  2. Associativity

Precedence	
Union	4
Concatenation	3
Kleene star	2
Id/terminals	1

Associativity		
Union	Left to right	Keep left recursion
Concatenation	Left to right	Keep left recursion
Kleene star	-	-
id/terminal	-	-

# Regular Expression Operators Example

Ambiguous Grammar

$$E \rightarrow E + E \mid EE \mid E^* \mid id$$

Unambiguous Grammar

$$\begin{aligned} E &\rightarrow E + E_1 \mid E_1 \\ E_1 &\rightarrow E_1 E_2 \mid E_2 \\ E_2 &\rightarrow E_2^* \mid E_3 \\ E_3 &\rightarrow id \end{aligned}$$

# If- else Problem

- Consider the following Grammar

$$S \rightarrow \text{if } E \text{ then } S \mid \text{if } E \text{ then } S \text{ else } S \mid \text{other}$$

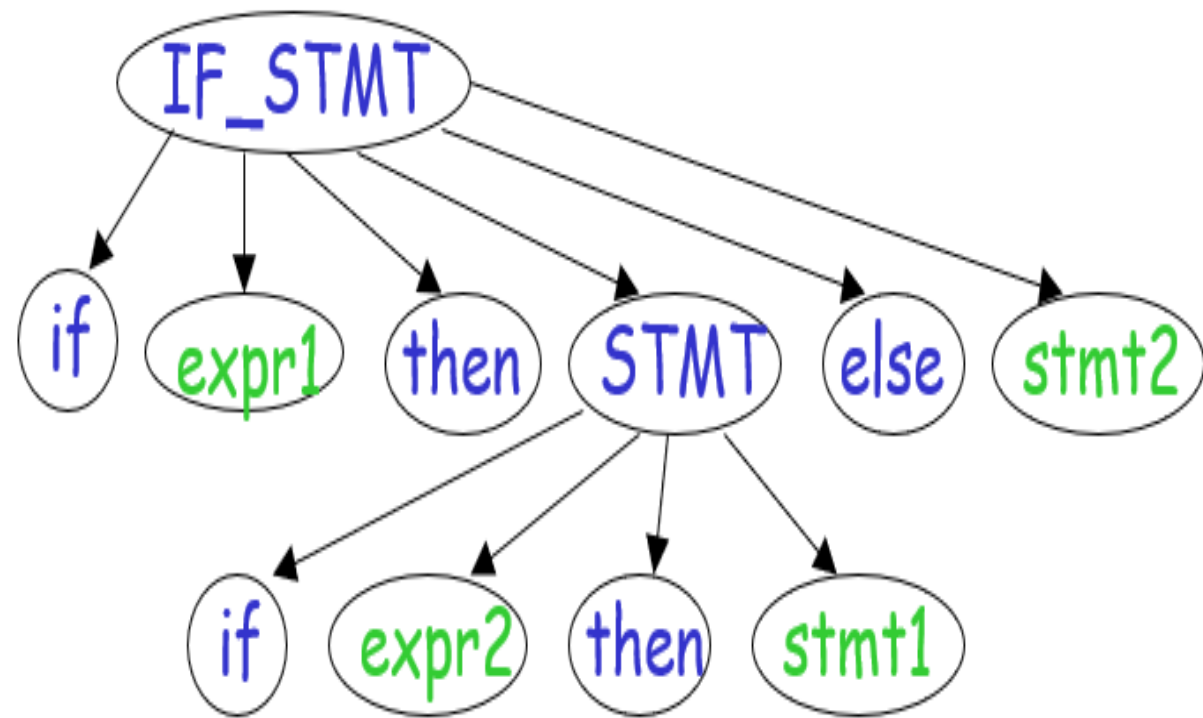

Where

E represent the Expression

S represent the Statement

# Parse Tree

# If else Statements

## Matched statements

It is either a non-if statement, or a complete if-then-else statement.

## Open statements

It is either a if-then statement (without else), or it is a if-then-else statement but the else-statement is an open statement.

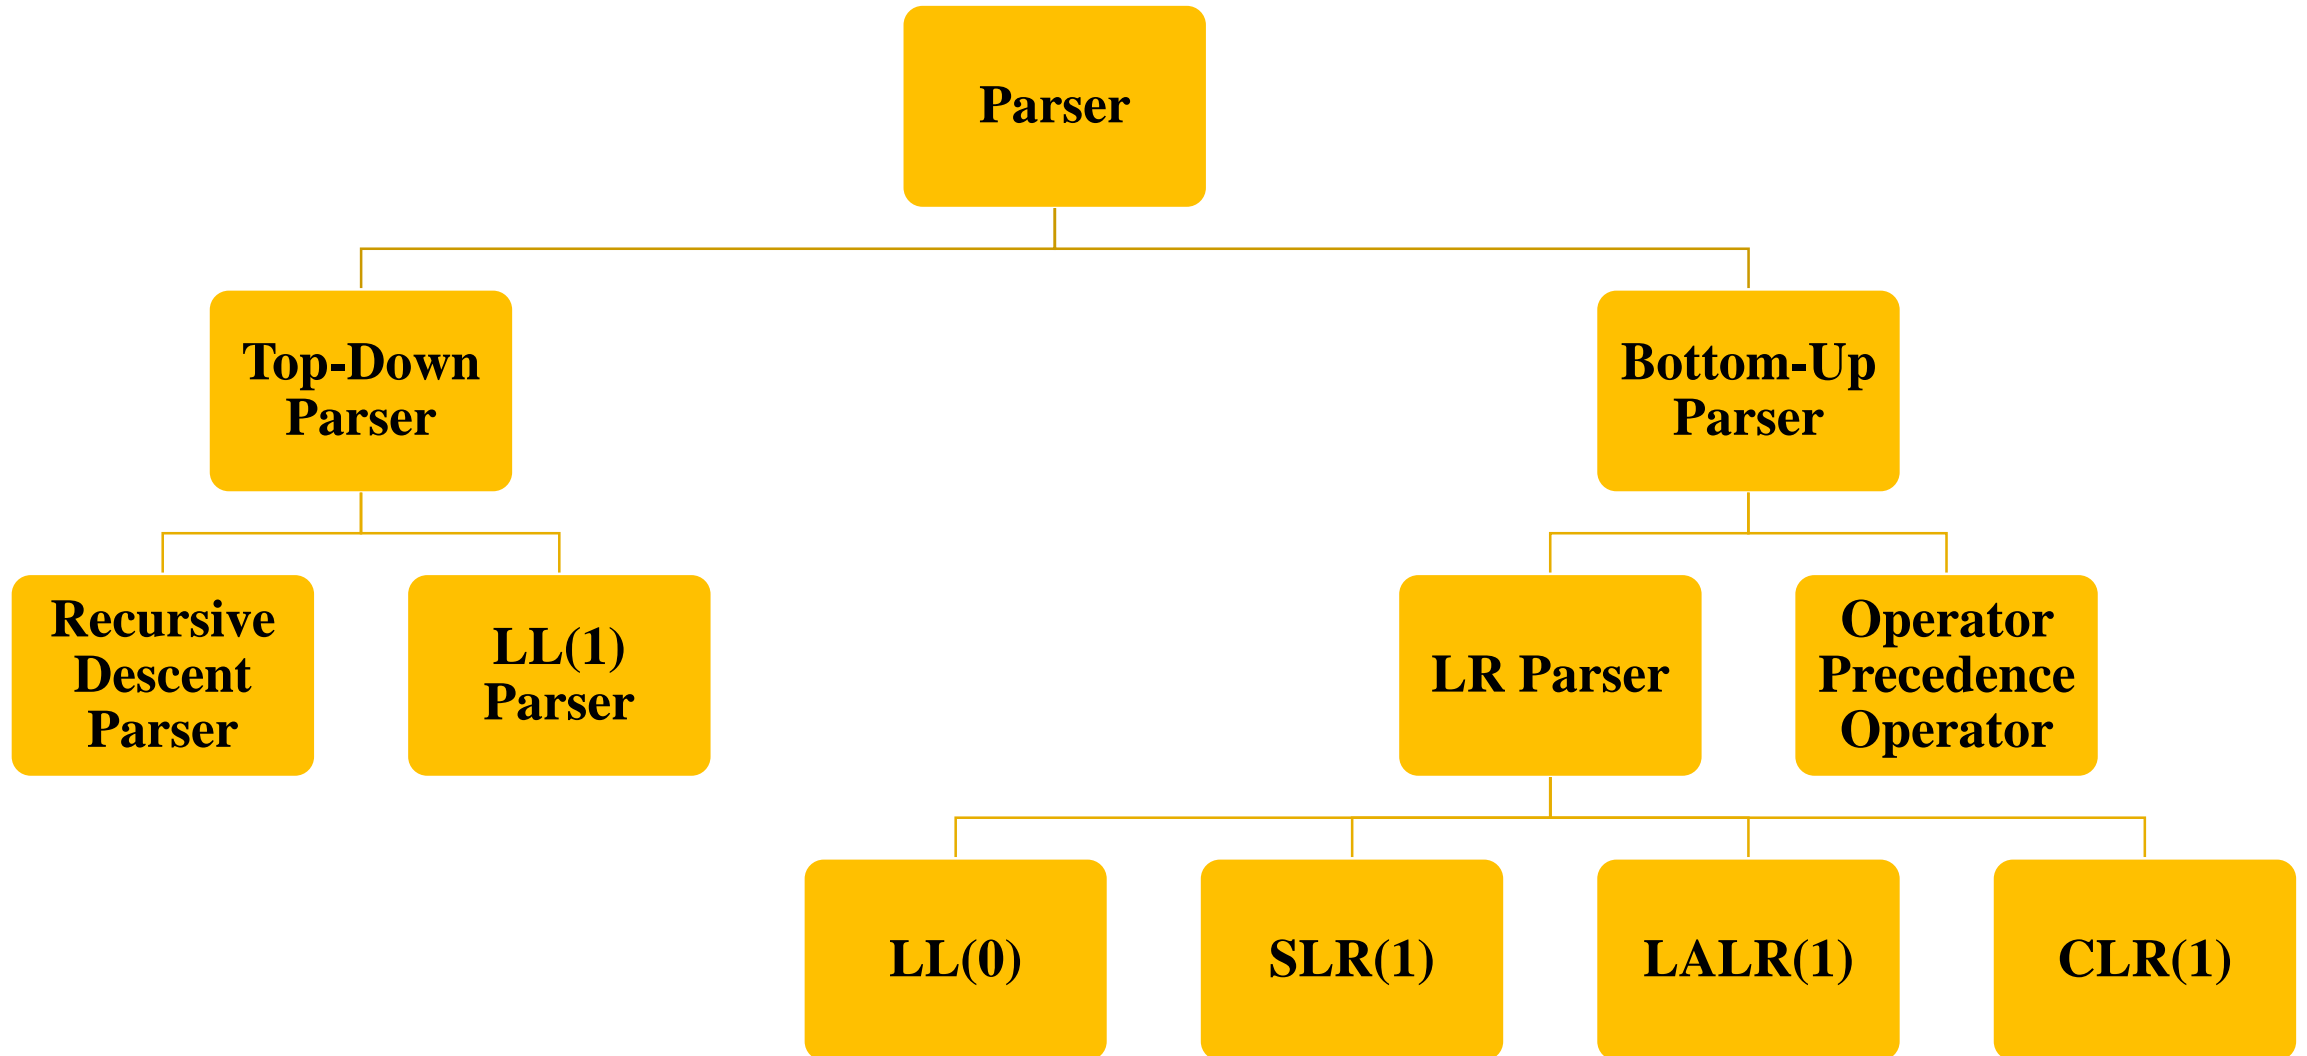

# Unambiguous grammar

```
stmt : matchedStmt  
      | openStmt  
matchedStmt : if E then matchedStmt else matchedStmt  
             | others ...  
openStmt : if E then stmt  
           | if E then matchedStmt else openStmt
```

# Example

- if E1 then if E2 then S1 else S2
- Can you construct two distinct parse tree for it?

# Parsing Technique

# Parser

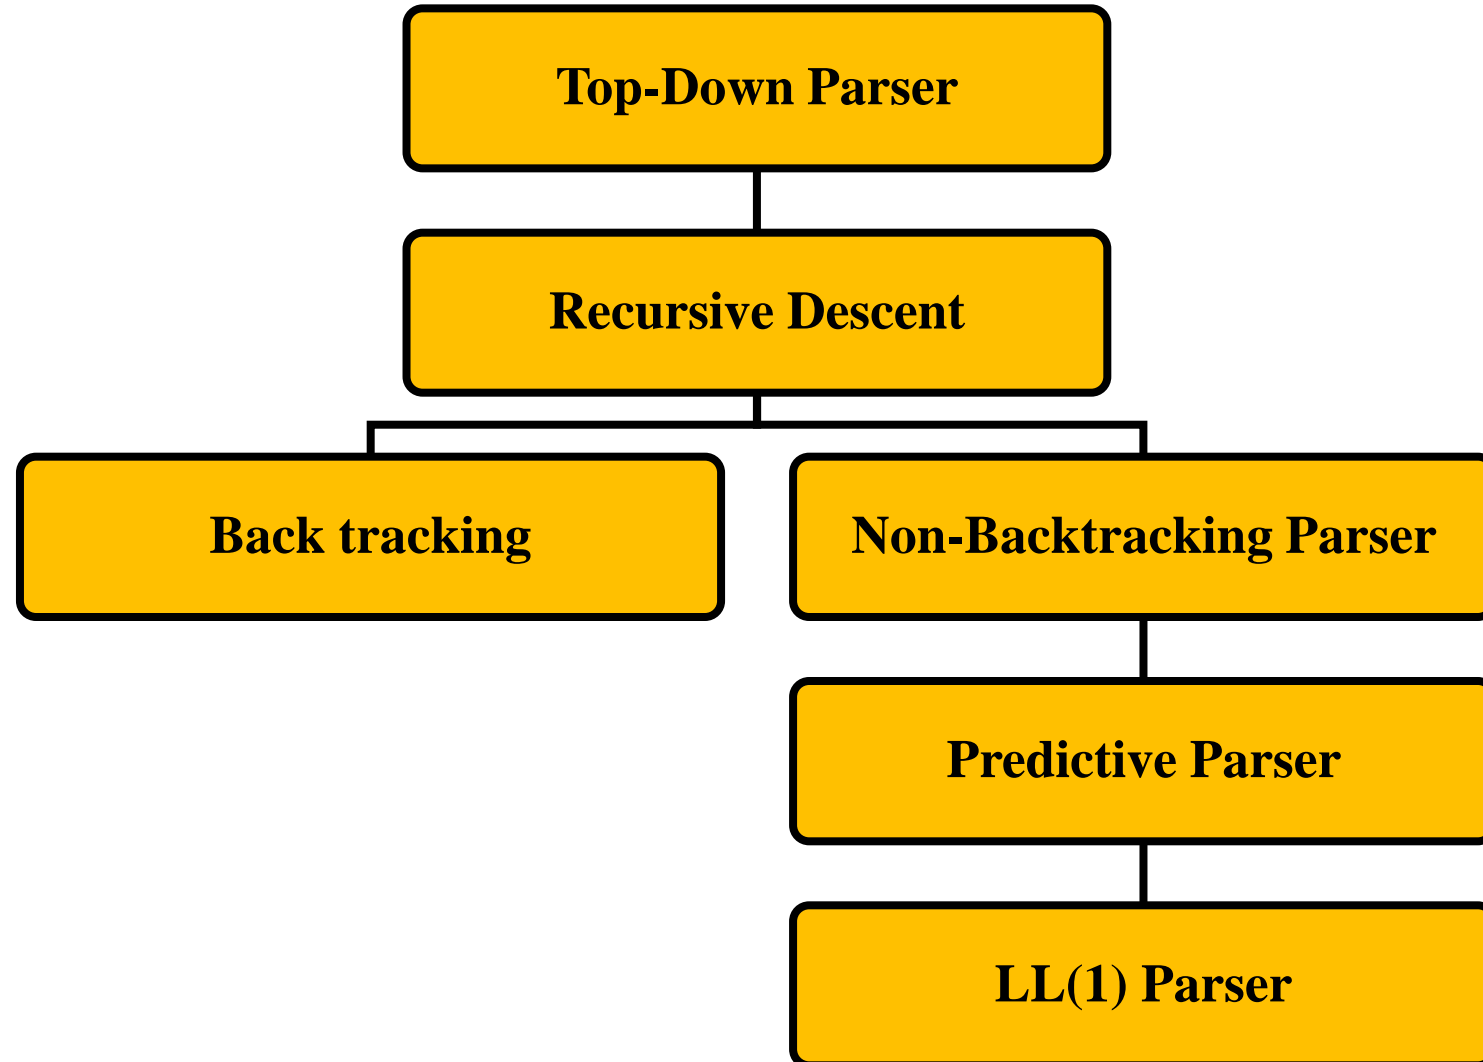

## Top-Down Parser

Top- Down **parser starts constructing the parse tree from the start symbol** and then tries to transform the start symbol to the input, it is called **top-down parsing**.

## Bottom-Up Parser

bottom-up parsing starts with the input symbols and tries to construct the **parse tree up to the start symbol**.

# Top-Down Parser

# Recursive Descent Parser

- Recursive Descent Parsing is a top-down method of syntax analysis in which a set of recursive procedures to process the input is executed.
- A procedure is associated with each nonterminal of a grammar.
- Top-down parsing can be viewed as an attempt to find a leftmost derivations for an input string.
- Recursive descent parsing involves backtracking.

# Example

- Consider the following grammar

$$S \rightarrow cAd$$

$$A \rightarrow ab \mid a$$

And the input string  $w = cad$ .

# Solution

# Top Down Parser

- In top down parser we have two types of parser

1. Recursive Descent

2. LL(1) Parser

1. First L represent the direction of look a head pointer.
2. L represent the type of derivation.
3. 1 means how many symbol we read from the string.
4. LL means we used left to right derivation and making the left most derivation tree.

# Condition of LL(1) Parser

- To construct a working LL(1) parsing table, a grammar must satisfy these conditions:
  - **No Left Recursion:** Avoid recursive definitions like  $A \rightarrow A + b$ .
  - **Unambiguous Grammar:** Ensure each string can be derived in only one way.
  - **Left Factoring:** Make the grammar deterministic, so the parser can proceed without guessing.

# LL(1) Parser

- The rules for LL(1) parsers are
  1. Remove left Recursion
  2. Remove Left Factoring
  3. Find the first and follow of the grammar
  4. Create Parse Table
  5. Create Parse tree

Example: Check whether the grammar is LL(1) or not.

- $E \rightarrow TE'$
  - $E' \rightarrow +TE' \mid \varepsilon$
  - $T \rightarrow FT'$
  - $T' \rightarrow *FT' \mid \varepsilon$
  - $F \rightarrow \text{id} \mid (E)$
- 
- $*\varepsilon$  denotes epsilon

# First of Grammar

- $E \rightarrow TE'$
- $E' \rightarrow +TE' \mid \varepsilon$
- $T \rightarrow FT'$
- $T' \rightarrow *FT' \mid \varepsilon$
- $F \rightarrow \text{id} \mid (E)$

Grammar Production Rule	Non-Terminals	First
$E \rightarrow TE'$	E	
$E' \rightarrow +TE' \mid \varepsilon$	E'	
$T \rightarrow FT'$	T	
$T' \rightarrow *FT' \mid \varepsilon$	T'	
$F \rightarrow \text{id} \mid (E)$	F	

# First of Grammar

Grammar Production Rule	Non-Terminals	First
$E \rightarrow TE'$	<b>E</b>	{id, ( }
$E' \rightarrow +TE' \mid \varepsilon$	<b>E'</b>	{+, $\varepsilon$ }
$\textcolor{red}{T} \rightarrow \textcolor{red}{F}T'$	<b>T</b>	{id, ( }
$T' \rightarrow *FT' \mid \varepsilon$	<b>T'</b>	{*, $\varepsilon$ }
$F \rightarrow \textcolor{red}{id} \mid (E)$	<b>F</b>	{id, ( }

# Follow of the Grammar

Grammar Production Rule	Non-Terminals	Follow
$E \rightarrow TE'$	Follow of (E)	(\$, ) }
$E' \rightarrow +TE' \mid \varepsilon$	$E'$	
$T \rightarrow FT'$	T	
$T' \rightarrow *FT' \mid \varepsilon$	$T'$	
$F \rightarrow \text{id} \mid (\textcolor{red}{E})$	F	

*Must Remember the follow of first symbol must have \$*

# Follow of the Grammar

Grammar Production Rule	Non-Terminals	Follow
$E \rightarrow TE'$	Follow of (E)	$\{\$, )\}$
$E' \rightarrow +TE' \mid \varepsilon$	Follow of $E'$	$\{\$, )\}$
$T \rightarrow FT'$	Follow of T = First of $E'$	$\{+, \$, )\}$
$T' \rightarrow *FT' \mid \varepsilon$	Follow of $T' =$ follow of T	$\{+, \$, )\}$
$F \rightarrow \text{id} \mid (E)$	Follow of F = first of $T'$	$\{*, +, \$, )\}$

*Must Remember the follow of first symbol must have \$*

# Parsing Table

Add all follow symbols in column  
Add the variable symbols in row

Grammar Production Rule	First	Follow
$E \rightarrow TE'$	{id,( }	{\$, ) }
$E' \rightarrow +TE' \mid \epsilon$	{+, $\epsilon$ }	{\$, ) }
$T \rightarrow FT'$	{id, ( }	{+, \$, ) }
$T' \rightarrow *FT' \mid \epsilon$	{*, $\epsilon$ }	{+, \$, ) }
$F \rightarrow id \mid (E)$	{id, ( }	{*,+, \$, ) }

	id	+	*	(	)	\$
E	$E \rightarrow TE'$			$E \rightarrow TE'$		
E`		$E' \rightarrow +TE'$			$E' \rightarrow \epsilon$	$E' \rightarrow \epsilon$
T	$T \rightarrow FT'$			$T \rightarrow FT'$		
T`		$T' \rightarrow \epsilon$	$T' \rightarrow *FT'$		$T' \rightarrow \epsilon$	$T' \rightarrow \epsilon$
F	$F \rightarrow id$			$F \rightarrow (E)$		

If the first any variable is  $\epsilon$  then move towards the follow of that variable.

Create the Parser Tree of the following  
 $\text{id} + \text{id} * \text{id}$

# Parse Tree

## Example 2: Draw the LL(1) parsing table for the given grammar ?

- $S \rightarrow iEtSS' \mid a$
- $S' \rightarrow eS \mid \epsilon$
- $E \rightarrow b$

	First	Follow
<b>S</b>	{i , a}	{\$, e, $\epsilon$ }
<b>S'</b>	{e, $\epsilon$ }	{\$, e, $\epsilon$ }
<b>E</b>	{ b }	{t}

Solution:

$S \rightarrow iEtSS' \mid a$

$S' \rightarrow eS \mid \epsilon$

$E \rightarrow b$

	First	Follow
<b>S</b>	{i , a}	{\$, e}
<b>S'</b>	{e, $\epsilon$ }	{\$, e}
<b>E</b>	{ b }	{t}

	a	b	e	i	t	\$
<b>S</b>	$S \rightarrow a$			$S \rightarrow iEtSS$		
<b>S'</b>			$S' \rightarrow eS$ $S' \rightarrow \epsilon$			$S' \rightarrow \epsilon$
<b>E</b>		$E \rightarrow b$				

**This grammar is not feasible for LL(1) Parser.**

Example 3: Draw the LL(1) parsing table for the given grammar ?

- $S \rightarrow aABb$
- $A \rightarrow c \mid \epsilon$
- $B \rightarrow d \mid \epsilon$

Example 4: Draw the LL(1) parsing table for the given grammar ?

- $S \rightarrow W$
- $W \rightarrow ZXY$
- $Y \rightarrow c \mid \varepsilon$
- $Z \rightarrow a \mid d$
- $X \rightarrow Xb \mid \varepsilon$
